### INTERNATIONAL PRELIMINARY **EXAMINATION REPORT - SEPARATE SHEET**

#### Re Item III

Claims 19-23 relate to subject-matter considered by this Authority to be covered by the provisions of Rule 67.1 (iv) PCT. Consequently, no opinion will be formulated with respect to the industrial applicability of the subject matter of these claims (Article 34(4)(a)(i)PCT).

#### Re Item V

Relevant prior art is provided by

- (A) EP 0617023
- (B) WO 0154771
- (C) EP 0477819
- (D) EP 0747354

#### **Novelty**

The overlapping parts of the current general formula (I) with the general formulae of (A) and (C) are considered to represent a novel selection therefrom. The novelty-destroying specific examples of (C) have been excluded from the present scope by means of a proviso. The current compounds appear to be novel vis-à-vis (B) on account of the "HIg" substituent in the 5-position of the central benzimidazolinone ring and over (D) essentially on account of the said central ring itself.

### Inventiv Step

The problem underlying the present application appears to be the provision of further benzimidazolinone derivatives which are better BK<sub>Ca</sub> channel modulators.

(A)-(C) represent the most relevant prior art. (C) appears to be the closest prior art since it discloses not only a general formula widely overlapping with the current one but also specific examples which would fall within the scope of current formula (I) if not prevented from doing so by means of the proviso. However, a proviso cannot render an application inventive. A selection invention which is only novel vis-à-vis the closest prior art on account of a proviso is therefore seen as a mere generalisation of the excluded specific agent of the prior art. Consequently, an inventive step in the sense of Article 33(3) PCT may only be acknowledged if the current selection has any unexpected advantageous effect vis-à-vis the closest prior art compounds, which in this case appear to be those falling within the scope of the proviso. The said effect, however, may in such a case of very close prior art not automatically be attributed to the whole

International application No.

PCT/DK 03/00402

general formula when shown for one single compound. Concerning the current application e.g. the four following comparative tests could be seen as an appropriate way of proving an inventive step: "Hlg" being chloro, bromo and iodo (current scope) compared to "Hlg" being fluoro ((C)) whereby R" always represents chloro, and a compound containing a substituent R" which represents anything but chloro (current scope) compared to another compound wherein R" represents chloro ((C)), whereby in both cases "Hlg" stands for fluoro. R' always has to be identical for each pair of comparison compounds. It should be noted that the comparative data on present pages 17 and 18 does not prove an inventive step since it does not relate to pairs of closest compounds because they differ in two substituents, not in only one. Thus, at present no unexpected improvement appears to be present so that an inventive step is preliminarily not acknowledged.

#### **Industrial Applicability**

For the assessment of present claims 19-23 on the question whether they are industrially applicable, no unified criteria exists in the PCT Contracting States. The patentability can also be dependent upon the formulation of the claims. The EPO, for example, does not recognize as industrially applicable the subject-matter of claims to the use of a compound in medical treatment, but may allow claims to a known compound for first use in medical treatment and the use of such a compound for the manufacture of a medicament for a new medical treatment.
